Freeze point is the temperature at which ice crystals begin to form, Burst point is the temperature at which the fluid overcomes the hydrostatic pressure of the pipe and bursts. Freeze point protection is necessary when the fluid and plumbing need to remain flow-able and pump-able; whereas Burst protection is necessary when equipment and/or plumbing remains idle or not in use and DefendAL Marine and RV fluids are used to displace residual water in engine cavities, equipment cavities, or plumbing fixtures that are not easily drained. If you suspect a significant volume of residual water in cavities or plumbing fixtures, consider using a lower burst protection fluid such as Glycerin Free -100 or -200.
